1 Abstract:

Vehicle steering dynamics is an essential topic in development of safety driving systems. These complex and integrated control units require precise information about vehicle steering dynamics. In the term of interaction between tire forces and road surface, we are going to primarily focus on the total resistance moment which is the factor torque that urges the tires to steer. This resistance moment that causes this combine with the wheel alignment will be described in below when considering the mass of vehicle, lateral force generation, longitudinal force generation and normal force generation. Through this Capstone project, this torque will be fully showed with the theoretically corresponding equations and combine with the model diagrams by using Matlab/Simulink software.

2 Objectives, scope and mission summary:

- Objective: focus on building mathematical models and simulations of the magnitude of this resistance torque under different driving conditions.
- Scope: only investigate the effects wheel alignment and specific factor on the total resistance torque.
- Mission summary: base on this scope, I will divide the whole objective into 2 main missions: The first one is get fully understanding knowledge about the resistance torque between the tire force and road surface in steering mechanism especially in the EPS system and the second one is how wheel alignment and other factors can affect to the resistance torque in steering mechanism especially in the EPS system and simulate by using Matlab/Simulink software.

3 Specific tire forces and wheel alignment:

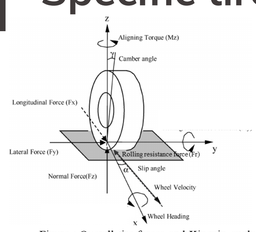

Figure : Overall tire forces and Kingpin angle

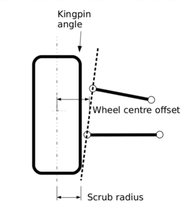

Figure : Kingpin angle and its scrub radius

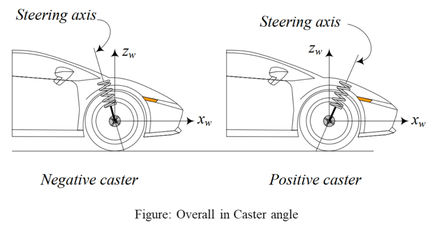

Figure: Overall in Caster angle

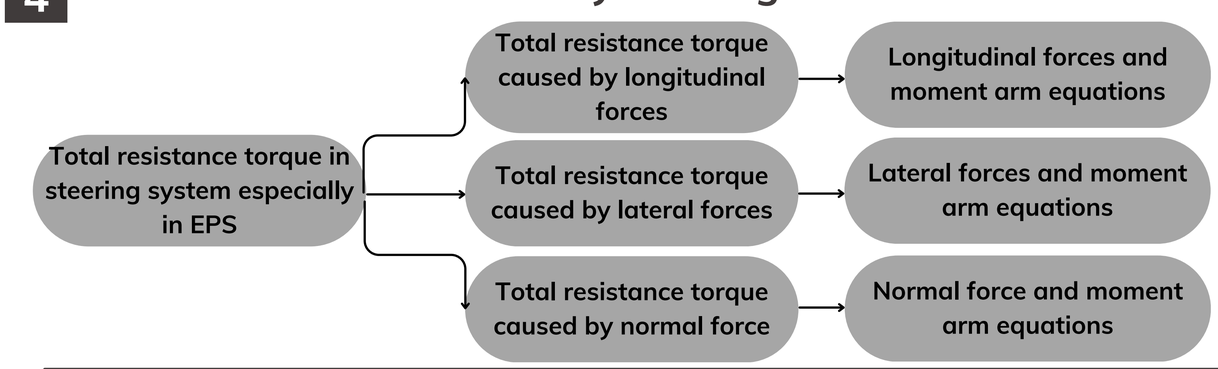
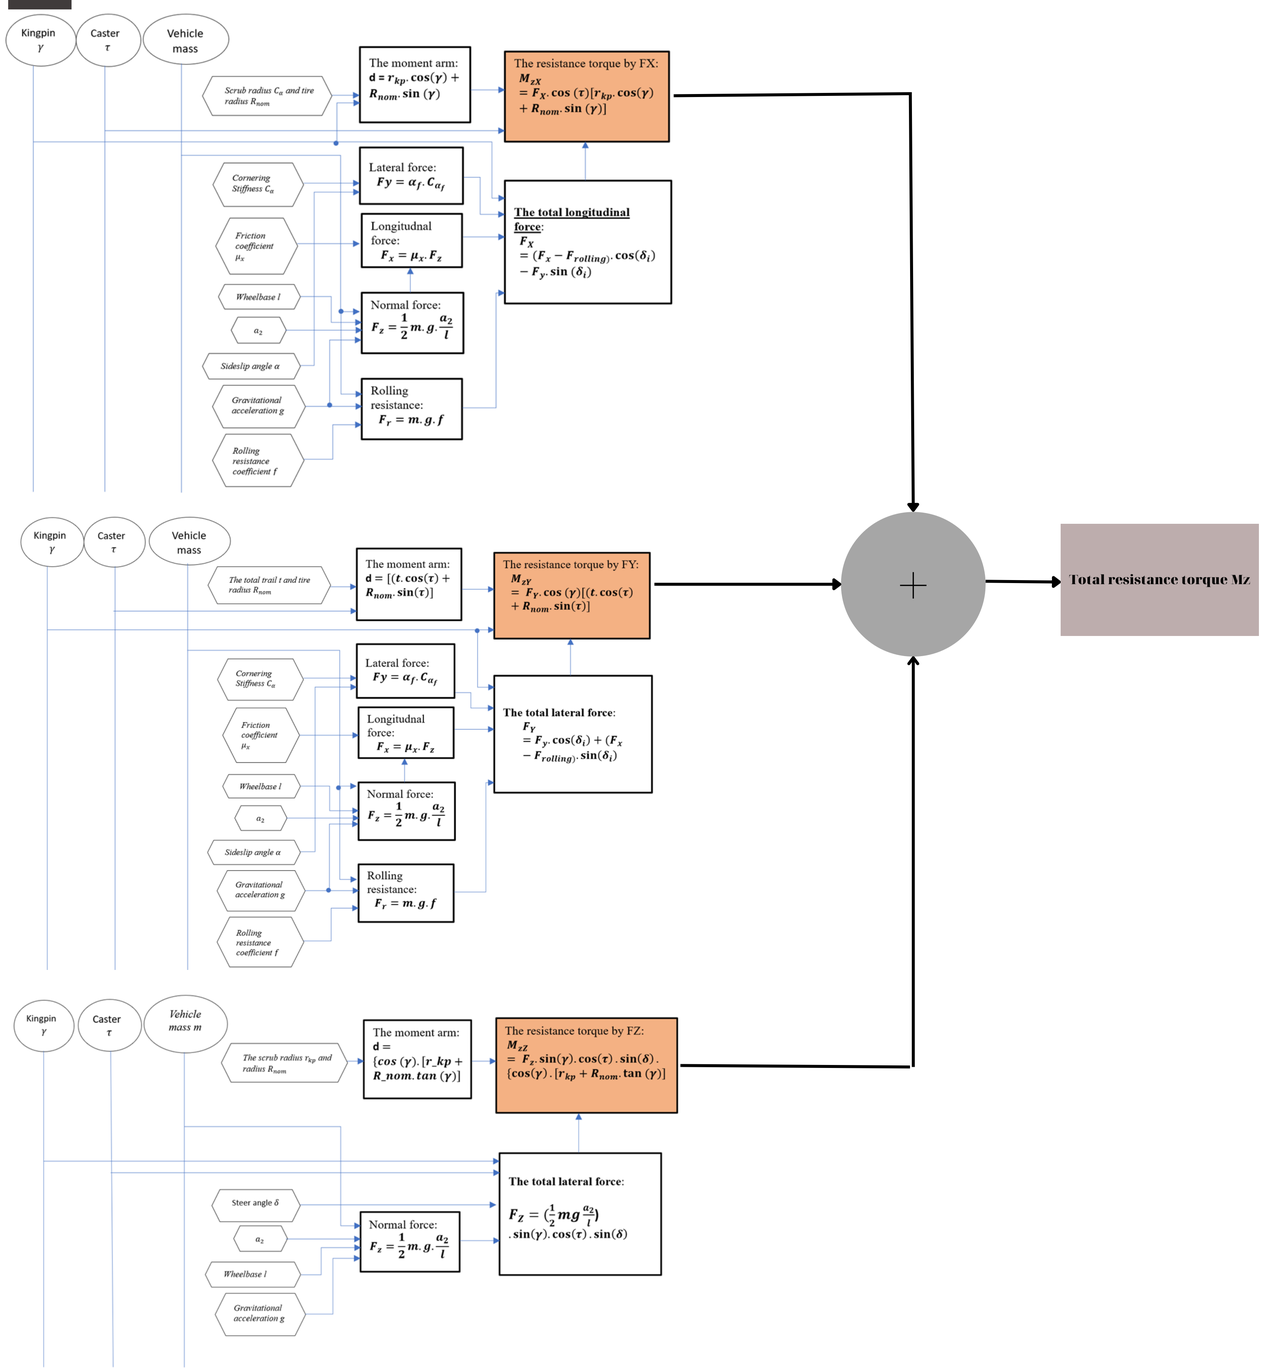
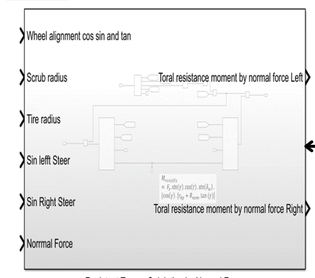
4 General mathematical layout diagram:



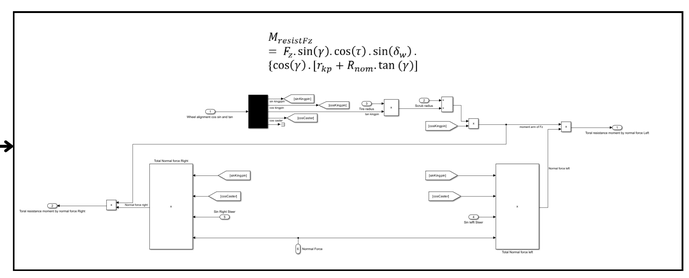
5 Calculation process diagram:

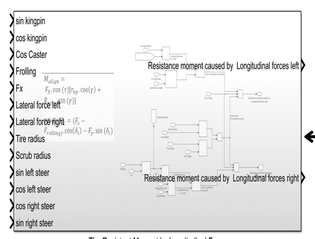


6 Matlab/Simulink modeling:

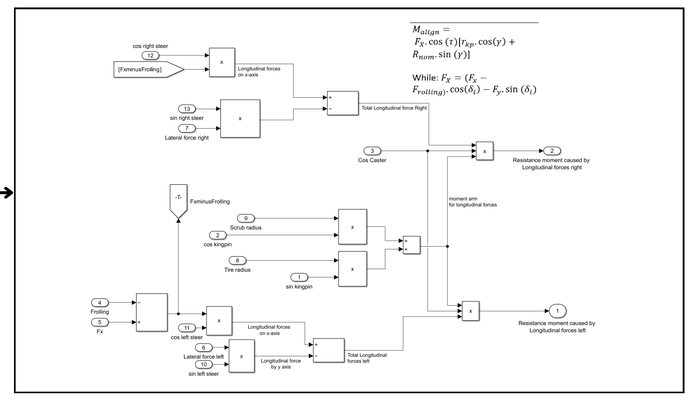


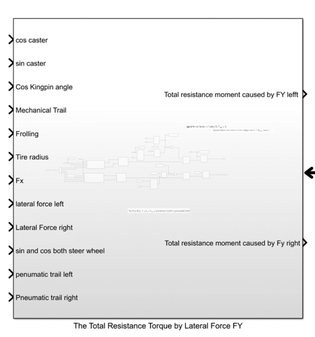
Resistant Torque Calulation by Normal Force



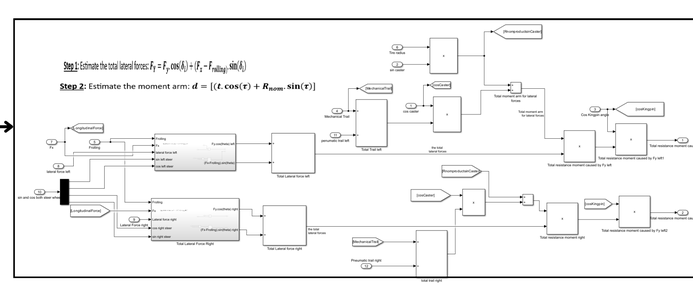


The Resistant Moment by Longitudinal Force

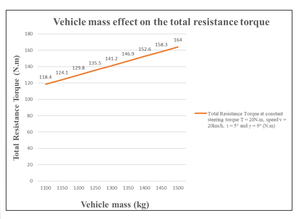


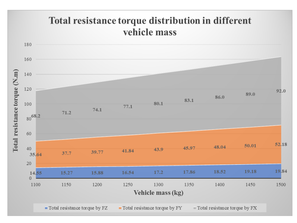


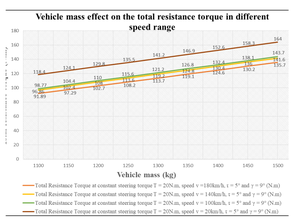
The Total Resistance Torque by Lateral Force FY



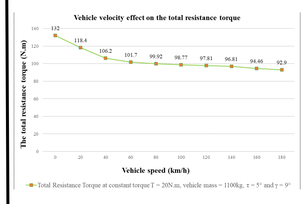
7 Specific results:

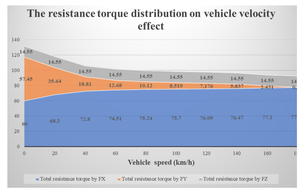


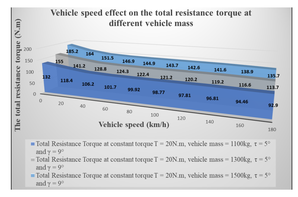




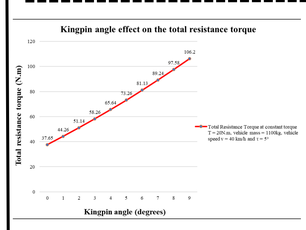
Changing in vehicle mass

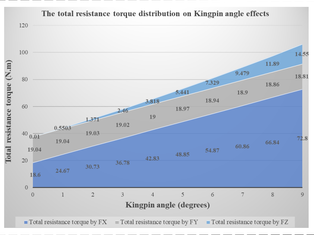


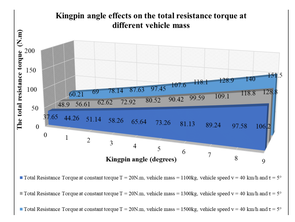




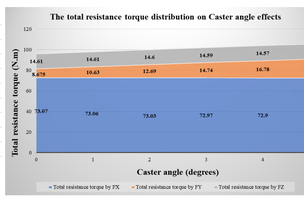
Changing in vehicle speed

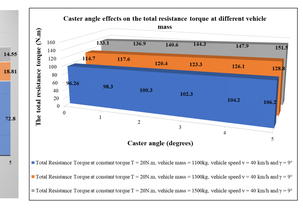






Changing in Kingpin vehicle wheel alignment





Changing in Caster vehicle wheel alignment

8 Conclusion and future plan:

- The main conclusion obtained in this Capstone project is how the wheel alignment especially Caster angle and Kingpin angle affect to the resistance moment in collaboration with specific factors such as vehicle mass, vehicle velocity,... Through all the figures mentioned above, we can conclude that wheel alignment has the huge impact on the total steering resistance torque in collaboration with vehicle mass and vehicle speed.
- In the future, it is recommended to develop this steering mechanism model and going further to simulate different situations by assist simulator such as Matlab/Simulink base on all relevant theories that mentioned in this Capstone project to provide the exact results in comparision with reality.

9 Acknowledgement:

This research is funded by Office for International Study Programs (OISP), Ho Chi Minh City University of Technology (HCMUT), VNU-HCM under grant number SVOISPLV-2022-KTGT-30,SVOISPLV-2022-KTGT-31,SVOISPLV-2022-KTGT-32. We acknowledge the support of time and facilities from HCMUT, VNU-HCM for this study. I want to express my gratitude to my family, who have always been by my side, accompanying, supporting, and assisting me in any way possible so that I can get to where I am now. I want to thank the teachers at Bach Khoa University in general and the Department of Automotive Engineering for their efforts. The knowledge I have gained from teachers over the last four years has assisted me in being brave enough to complete this project.

Sincere thanks to PhD. Ngo Dac Viet, PhD. Tran Dang Long created conditions for me to study, practice, and conduct field surveys.

Finally, I want to thank the reviewer and department lecturers for sharing their knowledge and providing me with feedback and suggestions so that I could finish this project.
